WHAT IS CLAIMED IS:

- 1. A print control apparatus which can be connected to a server that generates print data on the basis of printer information and information to be printed,
- 5 comprising:

10

25

an acquisition unit for acquiring printer information from a printer connected to said apparatus;

a transmission unit for transmitting information required to specify the information to be printed, and the printer information to the server;

a reception unit for receiving print data from the server as a response; and

a print control unit for controlling the printer to print the print data.

- The apparatus according to claim 1, wherein the printer information contains at least one of the number of elements of a print head, an arrangement order of elements, a print system, and types of colors used.
- 3. The apparatus according to claim 1, further

 20 comprising a display which is connected to a computer
 network, and displays data provided by a server
 connected to the computer network, and wherein a
 location of the information to be printed is
 transmitted to the server via a window which is
 - 4. The apparatus according to claim 3, wherein a print mode of the printer is input via the window which

displayed on said display and is provided by the server.

is displayed on said display, and the print mode is transmitted to the server together with the printer information.

- 5. The apparatus according to claim 1, wherein the printer information contains information that pertains to a position of a non-ejection nozzle, and image data is generated to control the printer to form an image using nozzles except for the non-ejection nozzle.
- A print system formed by connecting:
 a print control apparatus of claim 1;
 a server for generating print data on the basis
 of printer data and information to be printed; and
- 7. A print control method using a server that

 15 generates print data on the basis of printer

 information and information to be printed, comprising:

an acquisition step of acquiring printer information from a connected printer;

a printer.

a transmission step of transmitting information

required to specify the information to be printed, and
the printer information to the server;

a reception step of receiving print data from the server as a response; and

a print control step of controlling the printer 25 to print the print data.

8. A computer program product comprising:

a code of an acquisition step of acquiring printer information from a connected printer;

a code of a transmission step of transmitting information required to specify the information to be printed, and the printer information to the server;

a code of a reception step of receiving print data from the server as a response; and

a code of a print control step of controlling the printer to print the print data.

- 10 9. The program product according to claim 8, wherein the printer information contains at least one of the number of elements of a print head, an arrangement order of elements, a print system, and types of colors used.
- 15 10. The program product according to claim 8, wherein a location of the information to be printed is transmitted to the server via a window which is displayed on a display for displaying data provided by the server connected to a computer network and is provided by the server.
 - 11. The program product according to claim 10, a print mode of the printer is input via the window which is displayed on the display, and the print mode is transmitted to the server together with the printer
 - 12. The program product according to claim 8, wherein the printer information contains information that

25

information.

pertains to a position of a non-ejection nozzle, and image data is generated to control the printer to form an image using nozzles except for the non-ejection nozzle.

5
